

Inventory

"We are the Australian developers and distributors of Ice Vending machines and Collective Intelligence developed hardware specifically for our needs. They needed to integrate with a system from the US that simply would not work here. I must say that the full system was developed very quickly and with no hitches."

Gary Cutcliffe, Director - Kooler Ice

Complete, Efficient And Cost Effective Micro-Management Of Inventory

As business operations scale up, the management of inventory becomes more complex and in turn more inefficient. This can materially affect the ability to deliver stock in a timely manner and erode profit margins through additional fuel usage, higher human capital and asset costs.

CIG is dedicated to the design, production and implementation of innovative inventory, parts and stock management systems. With proven experience in delivering solutions to a wide range of sites, locations and industries from mining to warehousing, transport to food processing, CIG can implement effective mobile parts and stock management and monitoring solutions. Solutions are completely flexible and can be tailored to suit every need.

The CIG difference is achieved because each solution is designed and developed to incorporate dynamic and integrated inventory requirements with unrestricted capability.

Compelling Benefits to Effectively Manage Your Inventory

By combining your inventory management solutions with other proven CIG systems you'll not only be able to report on stock movement and usage, but instantly deliver stock re-order reports, manage service van routing and integrate daily performance statistics with your internal accounting systems. CIG can respond to complex requirements that other suppliers either can't, won't or will charge too much for, including:

- ✓ **Vending Applications:** CIG vending equipment applications can assist in scheduling and managing machine services, reorder details, restocking route management and a full range of performance reports. CIG remote management solutions can give error and conditional warnings, and movement sensors can protect against theft and damage.
- ✓ **Trades & Services:** Designed to report on the location of your people, remotely allocate their work, send them instant remote information and record and report on their actions. Remote management systems have been implemented to gain time and efficiency improvements in businesses with 2 or 3 remote vans or with hundreds of vehicles.
- ✓ **Mobile POS:** An effective system should act as a 'mobile warehouse' by recording and managing the necessary requirements and capabilities including product details in a fully categorised product library and complete customer information. Manage your inventory among hundreds of people on the move.
- ✓ **Real Estate Systems:** Used to manage all the requirements of managing multiple properties from allocating tasks to the appropriate contractor through to reporting on customer requests. Some functions include job tracking, reporting on all incoming customer, rental or agency requests, job prioritisation; and effective and efficient task allocation.
- ✓ **Stock Control:** The management of stock from delivery to storage to distribution and reordering is an entire business task in itself. With CIG, you can reduce mobile stock levels by 20%, reduce vehicle size and number to achieve the same work and allocate jobs based on proximity and materials available in mobile equipment.

Contact CIG today to learn how their mobile inventory and stock management systems can be implemented for your specific requirements.
